

Job Description: Technical Project Manager

Position Overview

We are searching for a technical and delivery-focused Project Manager to drive engineering velocity, scope coordination, and execution predictability across our development squads. In this role, you will streamline complex sprint cycles, clear blocker trajectories, and translate complex technical requirements into achievable technical milestones. You will serve as the core structural interface between executive management, operational business verticals, and engineering divisions to guarantee projects launch safely, on-time, and within scope.

Core Roles & Responsibilities

- Orchestrate end-to-end agile ceremonies, including sprint planning execution, backlog pruning, daily sync alignment, and retrospective analytics.
- Partner with tech leads to map inter-team software dependencies, flag implementation risks early, and coordinate strategic hotfixes.
- Maintain high Jira hygiene, constructing transparent sprint dashboards, burn-down trends, and milestones logs for broad organizational visibility.
- Identify, log, and proactively resolve workflow friction points to optimize overall engineering iteration speed and release stability.
- Synthesize complex engineering updates into clear, high-utility progress briefs tailored for non-technical leadership and external clients.

Required Qualifications & Experience

- Bachelor's degree in a technical or business discipline, or equivalent practical industry management background.
- 3+ years of technical project management experience driving deliverables inside software engineering or cloud-native teams.
- Deep practical mastery of Agile, Scrum, and Kanban methodologies, supported by heavy operational configuration experience in Jira and Confluence.
- Solid technical foundational literacy—ability to comfortably comprehend discussions regarding APIs, database scaling, and deployment tracks.
- Exceptional verbal and written messaging ability, with a track record of resolving conflicting priorities among diverse stakeholders.

Preferred & Nice-to-Have Skills

- Industry standard agile certifications such as Certified ScrumMaster (CSM), PMI Agile Certified Practitioner (PMI-ACP), or PMP.
- Familiarity with scaling frameworks like SAFe or managing dependencies across multi-squad software programs.

- Background working as a software developer, QA engineer, or systems analyst earlier in your career.
